

RealMoon

Realmoon: a new frictionless yield token on the binance smart chain

27 October 2021

v1.0

Notice: All participants should know their own jurisdictions: also, the liquidity is on PanCakeSwap and locked. 🐼

OVERVIEW & TOKENOMICS

The total token supply is **555,000,000,000** tokens with a **100% fair launch** for everyone, with single staking and locked liquidity for **999** years. The supply will include 230 Billion single staking reserve tokens. As an additional incentive for this new founding: **35.5** billion tokens will be allotted for an early founder bonus staking round! One billion tokens will be reserved for the development of the project. All transactions excise a **2% buyback and burn**. Features planned for future deployment include a Mobile iOS Android wallet in tandem with single staking. We will also develop and release our own DEX. Half of the available supply will be locked into single staking: and single staking fees will return to liquidity. The liquidity locked for 999 years will ensure a degree of capital protection.

One BNB token will be deposited with the rest of the supply in liquidity and then announced. After these initial steps are underway, we will commence focus and development of the Mainchain Network. The MainNet will be Quantum Proof.

CONTRACT ADDRESS
